NIH Telephone Service Directory and Information Locator System

(Software)

Whitlock, J. G.

National Institutes of Health, Bethesda, MD.

Corp. Source Codes: 242450 Report No.: NIH/DF-79/003

Jun 79 mag tape Languages: English

Journal Announcement: GRAI7921

Source Diskette is in EBCDIC character set and was recorded with the IBM Series I Event Driven Executive (EDX) Operating System. Copying is limited to the EBCDIC character set and the EDX Diskette format. Call NTIS Computer Products if you have questions. Price includes documentation, PB-297 875.

NTIS Prices: CP T06

The information locator was originally designed as a low cost version of the large Directory Assistance package used by many telephone companies. A main concern was for up-to-date camera-ready copy to be available for publication of the telephone directory. Two methods of information retrieval are supported: One is for the alphabetic files (the employees and patients), the other is for those files which have no logical method of organization. An example of such a file would be the organizational listing found in most government telephone books, which are organized by position within division. These files may be accessed as related records and viewed by scrolling backward or forward to locate information desired. The alphabetic files are accessed by keying in the first 3 letters of the last name (ex: SMI would cause displaying of all records from SMIA to SMIZ.) All additions, deletions or changes to the file are available immediately...Software Description: The program is written in the Event Driven Executive (EDX) programming language for implementation on an IBM Series I minicomputer using the EDX operating system. 48k bytes of core storage are required to operate the system. At least one 4979 Display Terminal and a 4974 Printer is required for successful operation of the system.

Descriptors: *Software; *Directories; Telephone systems; Information retrieval; Personnel; Magnetic tapes; Minicomputers

Identifiers: *Telephone directories; EDX programming language; NTISNIHTEL Section Headings: 88E* (Library and Information Sciences--Reference Materials); 62B (Computers, Control, and Information Theory--Computer Software)

01428094 INSPEC Abstract Number: C79034245 Title: Binary function search with history

Author(s): DeJonge, R.J.; Larson, L.E.

Author Affiliation: IBM Corp., Armonk, NY, USA

Journal: IBM Technical Disclosure Bulletin vol.21, no.10 p.3968-9

Publication Date: March 1979 Country of Publication: USA

CODEN: IBMTAA ISSN: 0018-8689

Language: English Document Type: Journal Paper (JP)

Treatment: Applications (A)

Abstract: An algorithm is disclosed which offers improved retrieval speed for searches against tabulated data. In operation, this algorithm is enhanced by the probability that a previously found item matches the first reference to a data table. In a search, any address calculation is generally postponed until after the initial reference is made. Subsequent references to any other portion of the table will exhibit a logarithmic response. The search algorithm utilizes a current index, which reflects the last referenced table entry. If the current index is zero, then the midpoint table address is calculated for the next iteration, and the search is continued. If the search argument is greater than or equal to the function argument in the table, and less than the function argument of the next table entry, then the current midpoint is the value returned to the calling program. Abstract (Basic): EP 876036 A
       The method involves displaying one of the entries on the display
    (1) and defines as a search key the first character of that entry .
    The search switch is used to extend the search key to include one or
   more subsequent characters of the displayed entry.
    The directory of entries is searched in alphabetical order to identify a first subsequent entry not commencing with the extended
    search key, and displaying the identified entry if one exists. The
   search key is initially defined as a null string and upon activation of
    the search switch the search key is redefined as the first character of
   the displayed entry.
       USE - Relates to method for searching alphanumeric data stored in
   electronic form.
       ADVANTAGE - Searches stored directory of alphanumeric entries using
    reduced number of search switches.

Abstract (Basic): GB 2130772 A

An electronic typewriter comprising key input means for inputting characters and instructions; memory means for storing documents inputted by said key input means and titles for said documents; discrimination means for discriminating an **order** of the titles stored in said memory means; and display means responsive to the discrimination of said discrimination means for displaying the titles in the **ordered** sequence.

DE 3337318 A

The typewriter allows the operator to search for text when the title has been forgotten. A title order memory enables rapid reference to be made to titles in order. A keyboard allows characters and instructions to be fed in. Textural data and associated titles fed in via the keyboard are held in a memory. A distinguishing controller defines a sequence of titles stored in the memory. The titles can be shown in sequence or a display.

The keyboard allows the operator to select forward or backward sequencing, through the title list. The display may be a single line device and the titles are in ASC11 code and the distinguishing controller contains an ASC11 code comparator.

ABSTRACT

PROBLEM TO BE SOLVED: To provide a data recording medium in which a reverse direction retrieving of a file is speedingly conducted.

SOLUTION: First and second storage sections are provided in each FAT entry which constitutes of a FAT recorded in a FAT region of a hard disk. In the first storage section, the number of a next FAT entry is written and the number of a previous FAT entry is written into the second storage section. When a normal direction retrieving of the file is to be conducted, the number of the next FAT entry written in the first storage section of each FAT entry is used. When a reverse direction retrieving of the file is to be conducted, the number of the previous FAT entry written in the second storage section of each FAT entry is used. Thus, a reverse direction retrieving of the file is conducted similarly the normal direction retrieving of the file at high speed.

ABSTRACT

PURPOSE: To obtain a dictionary capable of storing a large quantity of data by providing an index, making the number of coincident characters coincident with a just **prior** word correspond to the characters corresponding to the number of the coincident characters concerning each word following a leading word, and storing them.

CONSTITUTION: A word dictionary 503 is provided with an index 501 storing leading data of each data block corresponding to each block, a character number code 104 expressed making the number of the coincident character correspond to each character at the time of successively comparing each block data word with just prior data from leading data, and a data block part 502 storing a data block. Then, at the time of retrieval a block including a leading word with which retrieving data is coincident in the longest wards is detected from an index 501 to obtain the number of the already compared characters of a word coincident with the retrieving word of the block. When this number and the number of the coincident characters in the dictionary are equal to each other, a character following a character string corresponding to the number of the coincident characters and the uncompared character of retrieving data are compared.

ABSTRACT

PURPOSE: To easily attain the program searching of words by providing a means which detects the leading positions of the words positioned before and after displayed main sentence data, and moves the displayed result so that the detected words can be positioned at the head of a screen.

CONSTITUTION: The heading part of the word is surrounded by a heading start code and a heading end code, and the descriptive text of the word follows it. When a previous item key 1 is pressed, the word item just previous to the top item of the items displayed at the present screen is searched by the start code, and the searched item is displayed again by using the left corner of the screen as a start point. When the next item key 2 is pressed, the word item just after the top item of the items displayed at present is displayed again in the same way. Thus, the words can be successively displayed at the head of the screen, and the list of the words of a dictionary can be easily recognized.

Compressed index generation method for database - where word and metaword entries use prefix encoding which indicates number of bytes that unique word or metaword of next index entry has in common with previous entry

Patent Assignee: DIGITAL EQUIP CORP (DIGI)

Inventor: BURROWS M

Number of Countries: 001 Number of Patents: 001

Patent Family:

Patent No Kind Date Applicat No Kind Date Week US 5745898 A 19980428 US 96695906 A 19960809 199824 B

Patent Details:

Patent No Kind Lan Pg Main IPC Filing Notes

US 5745898 A 42 G06F-017/30

Abstract (Basic): US 5745898 A

The method involves sequentially parsing indexable portions of information to generate words and metawords. The words represent the parsed indexable portions of information. The metawords represent attributes of the indexable portions of information. A location is sequentially assigned to each word and metaword to form pairs. The pairs are sorted, first according to the words and metawords, and for each word and metaword, second according to the locations. Index entries are written to memory for each unique word and metaword.

Each index entry includes a word entry or metaword entry, and one or more location entries. The word and metaword entries use a prefix encoding which indicates the number of bytes that the unique word or metaword of a next index entry has in common with the unique word or metaword of a previous index entry. The prefix encoding indicates the bytes which are different between the unique word, or metaword of the previous and next index entries. The prefix encoding of the word is immediately followed by a termination byte. The location entries are sequentially stored following the word and metaword entries using a delta value encoding. The last location entry of each index entry is immediately followed by the termination byte.

USE - For use in e.g. World Wide Web applications ADVANTAGE - Minimises amount of storage, and time required to

perform index searches .

                                    Based on patent EP 747835
Abstract (Basic): EP 747835 A
       A data processing system (10) stored (26) entry is selected by
    scrolling through displayed (34) entries, each having alphanumeric
    symbols, listed alphabetically and numerically. Scrolling responds to a
    signal generated by control of the scroller. A character is selected
    from the indicated entry, responding to a position selection signal
    generated. A second scrolling signal causes the display to jump
    through the entries.
       The system jumps to a subset with the next or previous alphanumeric
    symbol compared with the currently indicated entry. The desired
    indicated entry is entered in response to a generated selection signal.
   The data entries may be geographic locations or telephone listings
   and the data processing system a vehicle navigation system. The system
   may include a display and two control scroller.
       USE/ADVANTAGE - Electronic navigation or data processing systems.
    Destination entry easily understood and efficient, low cost.

Abstract (Basic): CA 2097347 A

The individual wanting to make a call writes the name of the person or business they are calling on a pen-based tablet. The system accesses an internal CD-ROM, finds the name or business listed, **shows** it on the LCD screen, and if it's the correct one, it dials it, The telephone company provides the compact disk to subscribers.

The user prepares to write the name of the party who his calling by pressing a button (2). The user then takes a special pen (3) and writes the name on the pen based template (4). The system checks the pre-loaded compact disk (5) with a database of his local **telephone** book. The unit shows the closet possible listing on the LCD screen (6). The user may see the next possible listing by pressing a button (7). Alternatively, the user can ask the unit to dial what's on the screen by pressing button (8).

Intelligent dedupe for GoldMine

- Substantial cost savings from eliminating dupes
- Maintain the integrity of your data
- Communicate effectively with your customers
- Avoid potential embarrassment by eliminating duplicate communications

No matter how thorough your data input, inevitably your database will contain duplicate records. You have invested in an effective contact management solution for your most valuable resource — your customer and prospect data. So why throw money away by using duplicate data? It doesn't just waste money that could be spent on customer acquisition — it also annoys customers and damages your reputation if they receive duplicate information from you.

So how can you protect your data from the vagaries of human error? Quite simply you need an intelligent data cleansing tool that

does more than recognize exact matches. You need a fuzzy matching solution that is simple to use and will integrate seamlessly with your existing GoldMine® contact manager.

matchIT Contact — intelligent dedupe for GoldMine® gives you access to proven technology from helpIT systems, acknowledged experts in data cleansing. matchIT has established itself as the unrivalled solution for deduplication and fuzzy matching. Many leading mailing houses, data processing bureaus and major blue chip organizations rely on matchIT for their data cleansing requirements.

matchIT Contact delivers this highly effective solution to your desktop in a seamless interface with GoldMine®

The intelligent fuzzy matching routines within matchIT Contact will ensure you find duplicates that would otherwise remain undetected. In the example 'Mr W Dayton' has been found to match with 'Bill Deighton'. Similarly, the company acronym 'PAC' has been matched with 'Palmer Air Charters, Inc'.

findIT Contact is a software plug-in which seamlessly integrates with GoldMine to accurately notify users if records already exist on the system, findIT Contact doesn't rely on any single field for lookup and it allows for phonetic, miskeyed and abbreviated variations of names. This fuzzy matching also allows you to find records that you are having difficulty locating.

FONECTA'S ELECTRONIC DIRECTORY SERVICE ENHANCED WITH MCORRECTION™

3.5.2004

Fonecta Ltd. has selected mCorrection™ fuzzy search software electronic directory services available to internet and mobile d mCorrection will also be utilized in Fonecta ProFinder - a cont update service targeted to professional business users.

mCorrection™ is an intelligent fuzzy matching search tool that automatically corre and letter ordering mistakes, as well as syntax errors frequently made by director information. mCorrection, developed by Syslore Ltd., is based on advanced math unique features include language independent solutions and outstanding scalab extremely large or complex multi-field databases.

Intelligent error correction offers a compelling new feature to users who are often simple searches due either to input related errors and/or differences in the way a and how the stored data itself being searched is configured. Nowadays one of th related problems is considered to be information retrieval since most query platfo whereas the correct spelling of a word can be hard to remember and misspellings

"The integration of fuzzy search further improves the user experience of Fone services by correcting for such common errors, thereby not only improving the qu customer satisfaction, but also the actual usage of the services as well", Mr Harr development in Fonecta Group.

Syslore believes that Fonecta, because of Fonecta's robust, extensive, and service, offers an ideal showcase for mCorrection's advanced fuzzy matching tec enhance a number of Fonecta's existing consumer and business application area increased ease of use and customer satisfaction, and subsequent expanded u directly to the bottom line.

Information will be easier and faster to find for all Internet based directory serv mobile service requests, any inexact or otherwise ambiguous service transaction time. Moreover, the data update services recognition level of customer informatio simultaneously improved by essentially switching the update process from manual

PLUS Search Results for S/N 10796457, Searched February 17, 2005

The Patent Linguistics Utility System (PLUS) is a USPTO automated sear ch

system for U.S. Patents from 1971 to the present. PLUS is a query-by-example search system which produces a list of patents that a re

most closely related linguistically to the application searched. This search was prepared by the staff of the Scientific and Technical Information Center, SIRA.
